

Eu151 EdH $32^3 \times K_3$ long hold (phase 2 = $10 \omega^{-1} \approx 14.5$ ms)
 $K3 = 1e-41$ m⁶/s (Dy-like) + $\gamma_dr=0.02$ + LHY scalar. Final norm = 0.9962, peak n stable around $1.10e-02$

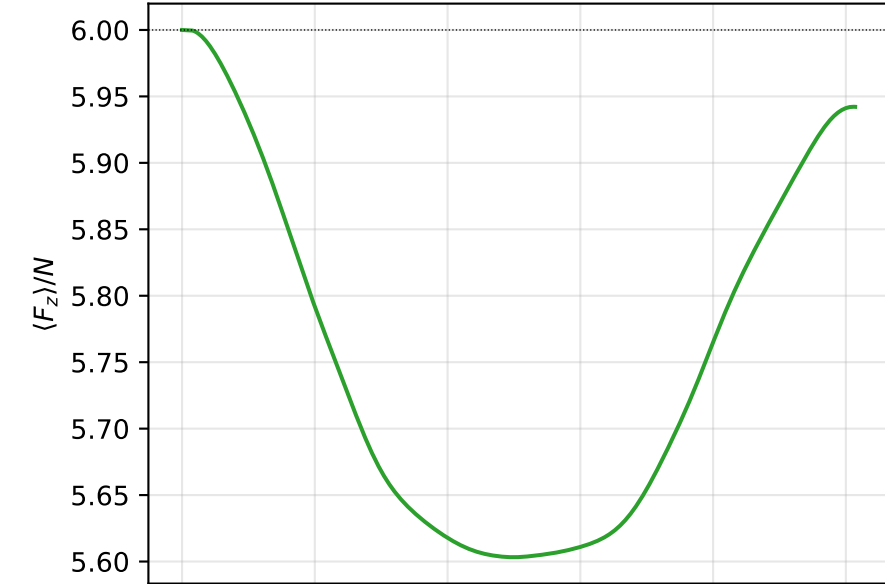

(a) atom-number conservation

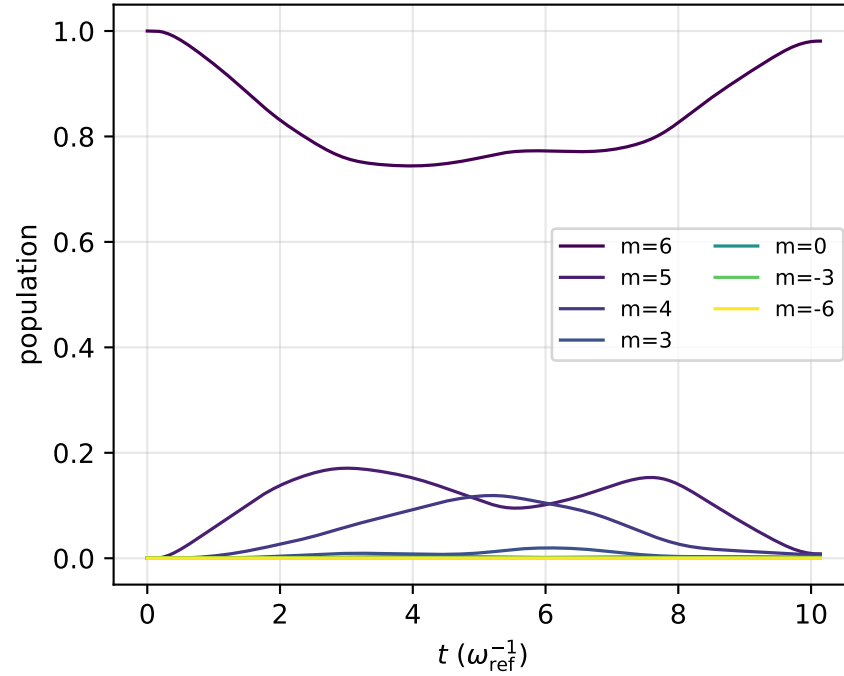

(b) peak density (collapse signature)

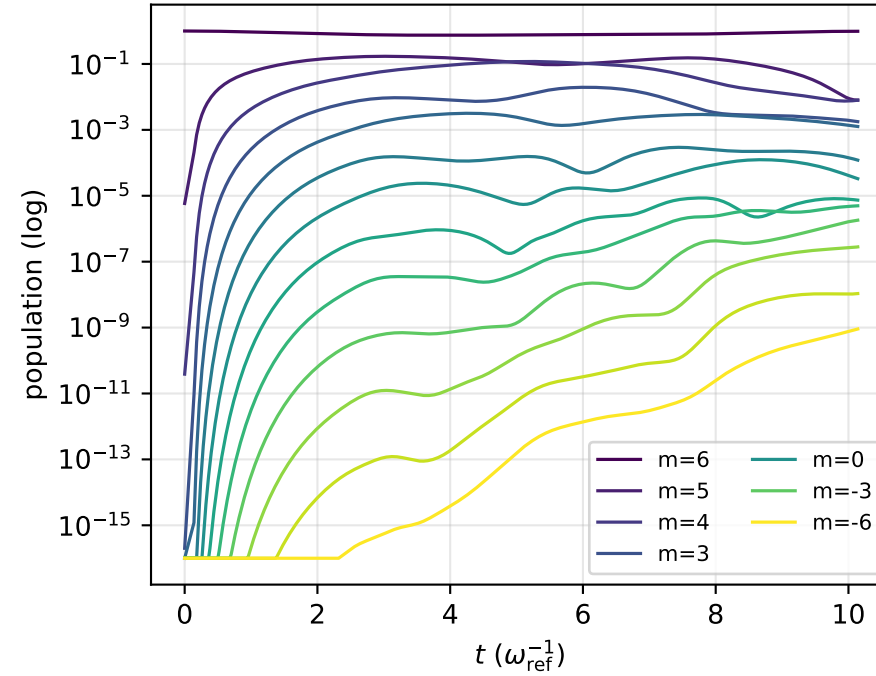

(c) EdH spin transfer: $m=+F \rightarrow$ lower m

(d) per-m populations (linear)

(e) per-m populations (log)

(f) Δ pop relative to initial $m=+F$ state
